

leanpdf sample

A small document to try the tools with

This file was made for the leanpdf website. It has photos that can be made smaller, a page of text to search, a chart drawn with vector graphics, metadata and bookmarks. Open it in the viewer and try the tools on the right.

How it works

leanpdf reads a PDF in small slices and writes the result in one pass, so memory use stays flat whatever the size of the file. Anything it does not change is copied byte for byte.

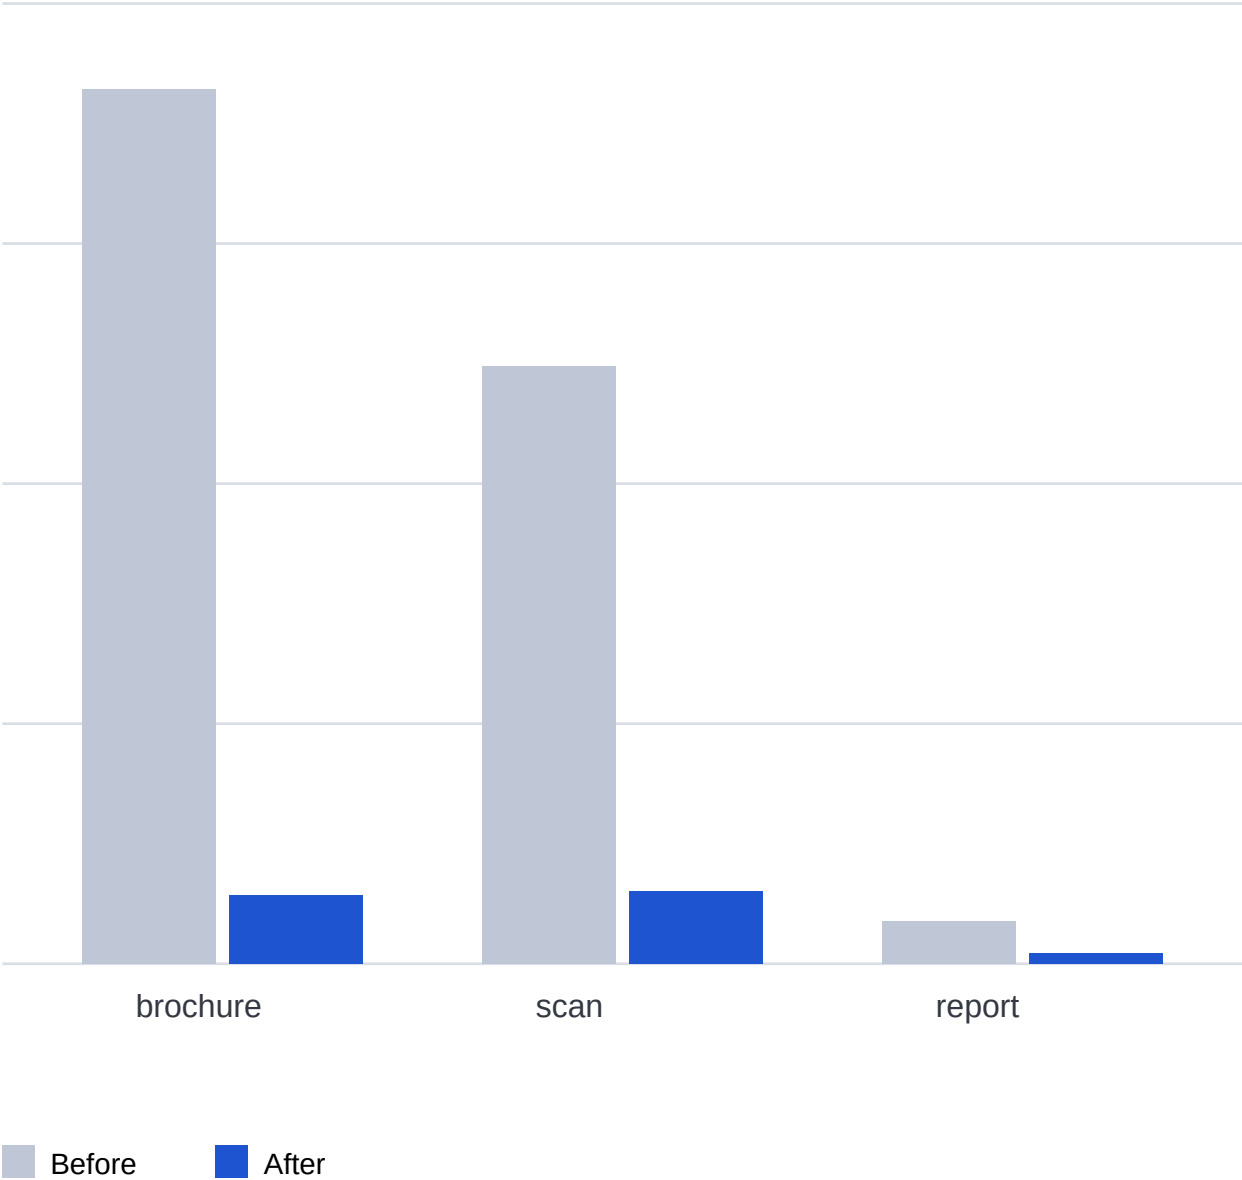

Compressing scales images down to fit a maximum size and encodes them as JPEG again. A new image is kept only when it is at least ten percent smaller than the one it replaces.

The same reader extracts text, metadata, bookmarks, form fields and attachments, and renders pages to a canvas. Editing selects, reorders and rotates pages, removes metadata, scripts and attachments, merges files and removes encryption.

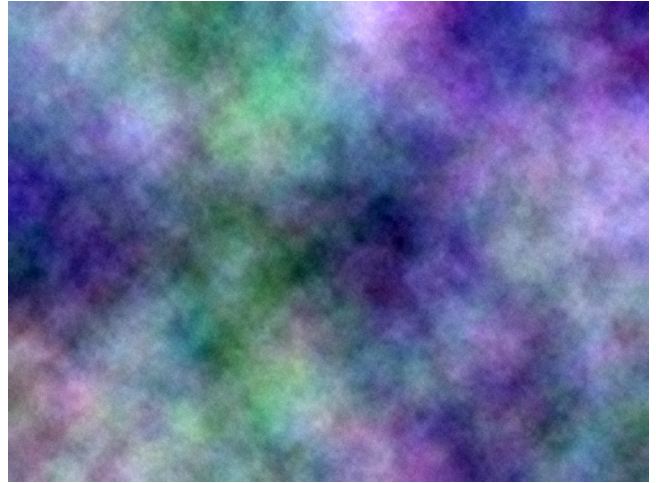

Everything on this website runs in your browser, in a background worker. The file you open never leaves your device.

Photos

Two more photos. Compressing scales them to the size set in the toolbox and keeps the result only when it is smaller.
